

Live Trading Grid

Up to eight live Indian-market charts on one screen. Private, and yours alone.

Signing in

The dashboard is private. It opens to a **Sign in with Google** button, and only approved accounts get through — everyone else is signed straight back out. No password to remember or share.

Choosing your layout

Top right there is a **Charts** selector. Pick a number and the screen rearranges instantly. The number keys 1, 2, 4, 6 and 8 do the same.

Charts	Layout
1	Full screen
2	Side by side
4	Two across, two down
6	Three across, two down
8	Four across, two down

Each chart is independent

Every chart has its own symbol, time period and data source, set from its header.

- **Symbol** — start typing and matches appear, by ticker or by company name. Typing "tata" finds Tata Steel, Tata Motors and TCS. Anything not in the list can be entered as typed, and is remembered.
- **Timeframe** — 1m, 5m, 15m, 30m, 1h, 1D, 1W, 1MO. Monthly charts reach back decades.
- **Source** — where the prices come from (below).

Watching Reliance on a 5-minute chart beside NIFTY on a monthly one is the normal way to use it.

The price bar

A coloured strip under each header shows the symbol, the change, and the live price. It **flashes green** when the price ticks up and **flashes red** when it ticks down — the quickest way to spot movement across eight charts without reading a single number.

The change figure means: on intraday charts, the move since yesterday's close ("change today"). On daily, weekly and monthly charts, the move so far this day, week or month.

Indicators — the "fx" button

Indicator	What it shows
SMA (two of them)	Simple moving averages, e.g. 20 and 50 at once
EMA	Exponential moving average — reacts faster to recent prices
Bollinger Bands	A volatility envelope around the average
RSI	Momentum 0–100, in its own band below the price with 30 / 70 guides

Every period is editable, and each chart remembers its own selection.

Price alerts — the bell button

Set an alert **above** or **below** a price. When it triggers you get an on-screen message, a chime and a desktop notification. The bell shows how many alerts are live and turns red once one has fired.

Alerts fire on a **crossing**, not just on the condition being true. Setting "above 100" while the price is already 105 will not fire straight away — it waits for the price to come back down and cross up through 100.

Worth knowing: alerts are checked inside your browser, so they only work while the dashboard is open in a tab. Nothing will reach you overnight or with the laptop shut.

Reading the chart

Action	Result
Hover	Crosshair with the exact price and time
Scroll	Zoom in and out
Drag	Move back through history
Double-click	Snap back to the default view
Pinch / swipe	Zoom and pan on a phone or tablet

Where the prices come from

	yfinance	Zerodha (Kite)
Cost	Free, always on	Your own paid Zerodha API plan
Speed	Delayed, around 15 minutes	Live exchange ticks
Setup	None	Connected once in Settings

You can mix them across charts. Both only move during market hours, **9:15am to 3:30pm IST, Monday to Friday**. Outside those hours nothing flashes — that is the market being shut, not a fault.

Settings — the gear icon

Where Zerodha is connected: paste your API key and secret, click through to Zerodha's login, paste back the address it returns you to, and your charts switch to live data.

This login is repeated once each trading day. Zerodha expires the connection every morning around 6am for security. It takes about thirty seconds, and your key and secret stay saved — only the sign-in repeats. Credentials are kept on the server and never sent to your browser.

It remembers you

Close the tab and come back tomorrow: your layout, every chart's symbol, timeframe and indicators, and any symbols you typed yourself are exactly as you left them. There is no save button. It works the same on a phone, where the charts stack into a single scrolling column.

Deliberately not included

- **No trading.** It cannot place, change or cancel orders. It only reads prices.
- **No drawing tools** — no trendlines or Fibonacci retracements.
- **No background alerts** — see the note above.
